

DigiStayBook legal and privacy review pack

Prepared 2 October 2026 | Updated 5 October 2026 | Review version 2 | Guest contributions and related host terms

Version 2 aligns the memory and private-feedback screening labels and adds automatic restricted safety routing for serious memory text flags. These changes are in the local source; this update does not deploy them. The live metadata below remains the recorded 2 October snapshot. Exact legal drafts remain the supplied draft versions and require review against the updated flow.

Please review the full draft documents and the actual processing and operating arrangements described here. Return amendments, a list of unresolved conditions and an explicit approval record for the final document versions. Public guest submissions remain disabled. This pack records facts, draft commitments and open decisions; it does not supply approval.

How to use this pack

Start with the decision register and the processing inventory. Read the full Host Terms, Guest Terms, Privacy Policy and consent wording in the appendices. Record corrections against the source clause and complete the response form. The ZIP includes the relevant source files, operating handbook, evidence snapshots, screening fixtures and a checksum manifest so review can continue without access to the developer checkout.

Audience: qualified legal/privacy reviewer, product owner and engineering release owner. A reviewer may annotate this PDF or complete reviewer-response.md. No production login, private guest data, credentials or secrets are included.

Section	Purpose
Review scope and evidence	What is implemented, verified, proposed or unresolved
Processing and data inventory	Collection, recipients, access, location and deletion
Decision register and controls	Questions needing legal/product/operations decisions
Complete legal drafts	Exact Host Terms, Guest Terms, Privacy Policy and consent
Guest reporting wording	Current public reporting experience
Screening and release checklist	Tests, limits and remaining production proof
References and approval form	Evidence index, provider sources and signoff

Review scope and evidence

Primary scope is guest memories, private feedback, photo handling, consent, overseas screening, content review, reports and deletion. The Host Terms are included in full because account, subscription, liability and host responsibilities interact with this flow. Marketing, billing, exports and host data are included where the Privacy Policy makes statements about them; those statements need their own implementation evidence.

Code and handbook snapshots were assembled from the current working tree, which contains uncommitted work. File hashes identify this pack precisely; a Git commit alone does not identify every attached file. Exact draft wording is preserved, including statements that need correction. Source presence is not proof that a feature is deployed, staffed or compliant.

Evidence level	Observed state or limitation
Current source	The relevant code has been reviewed, including shared serious-text safety rules and waiting for incomplete scans. Legal sign-off has not been recorded (legalApproval is null). The 5 October screening changes are local source changes; deployment and live-flow proof remain required.
Live metadata on 2 October	finishGuestContribution ACTIVE; revision finishguestcontribution-00014-kif; production contribution flag false.
Live bucket metadata	Both guest buckets are AUSTRALIA-SOUTHEAST1, with uniform access and public-access prevention enforced; recovery retention 604800 seconds (7 days).
Earlier session checks	123 Functions tests passed; build and selected function deployments completed. These are recorded checks, not a fresh independent audit.
5 October local checks	135 Functions tests passed and Functions build passed. Emulator server checks passed, including memory safety routing/host approval denial and private-feedback outage retry/recovery/exhaustion. These are local checks; provider calibration, deployment and live guest proof remain separate.
Email configuration	75-attempt monitoring alert and A\$1/A\$5 monthly screening warnings configured for codebertcreations@gmail.com. Inbox receipt remains unverified.
Outstanding production evidence	Runtime provider access/classification quality, direct object-access denial, guest submission journeys, deletion deadlines, reviewer staffing/MFA and real device behaviour.

Live metadata snapshot time: 2026-10-02T11:11:13.0052642Z. The snapshot intentionally excludes unrelated environment variables. Project and resource identifiers are included for traceability, not as credentials.

Service and processing flow

DigiStayBook provides property-specific guestbooks for short-term rental hosts. A guest opens an in-stay link, establishes a property-specific anonymous Firebase session and chooses either a public memory or private feedback. The product does not provide booking support or a host-to-guest messaging service.

Step	Memory route	Private feedback route
Collection	Message plus optional photos and public-display consent	Text-only complaint or feedback; no public-display consent
Storage	Private quarantine bucket for photos, plus a private guest submission record for the message, photo references and status	Private guest submission record for the feedback text and status
Screening	Australia text endpoint; transformed photo bytes to EU Vision endpoint	Australia text moderation endpoint
Decision	Clear; Flagged for host; Flagged for safety review; Screening pending. See shared outcomes below.	Clear; Flagged for host; Flagged for safety review; Screening pending. See shared outcomes below.
Public visibility	Only after publication and state checks; photos served through application endpoint	Never shown on the public wall
Failure and capacity	Screening pending: if the check cannot complete, keep the memory unpublished and retry before publication	Screening pending: if the check cannot complete, keep the feedback undelivered and retry before host delivery
Removal	Self-delete hides immediately and queues object deletion; report/lost-session workflows also exist	Safety review can release/delete held feedback; retention schedules need approval

Shared screening outcomes

Outcome	Memory route	Private feedback route
Clear	Publish to the public guestbook after all required checks pass	Deliver privately to the host; never publish
Flagged for host	Hold for host review before publication: profanity or other ordinary flags without a serious safety flag; public contact details and external links also trigger this route	Deliver privately to the host for consideration: profanity or ordinary complaints without a serious safety flag; the host can report a message for safety review
Flagged for safety review	Automatically keep unpublished and open a restricted safety case for a serious text flag; the host cannot approve it	Automatically withhold host delivery and open a restricted safety case for a serious text flag
Screening pending	If screening cannot complete, keep unpublished until it can be checked; retry, then alert operations if repeated failures need attention	If screening cannot complete, keep undelivered until it can be checked; retry, then alert operations if repeated failures need attention

Both text routes use the same serious-category rules: Violent, Sexual, Derogatory, and Firearms & Weapons at the existing provisional confidence threshold of 0.8. A serious flag takes priority over an ordinary profanity flag. Provider confidence measures confidence in a category, not how severe a swear word is. Profanity alone does not open a restricted safety case. Context, slang, reported incidents and benign references still require calibration; these rules do not guarantee every harmful message is detected.

This update adds automatic safety routing for memory text only. Current photo flags still go to host review. Automatic serious-image routing remains an open decision requiring image examples and calibration. There is no automatic rejection. Clear private feedback and feedback flagged for the host both reach the private inbox; feedback has no publication approval step. Memory safety cases are recorded in the restricted queue, but the operations case-opening and resolution controls currently support private feedback only. Complete and test the memory-case review controls before opening intake.

Memory upload allowance: up to ten JPEG/PNG/WebP photos, 5 MiB each, 25 MiB total and 40 megapixels per photo. Processing rotates, strips metadata and converts to WebP within 2000 by 2000. Message and feedback length is 1,200 characters. These upload limits are provisional; acceptance on real devices and HEIC treatment are unresolved.

Vision receives transformed image bytes, without guest session ID, property name, caption, storage URL or original filename. Redirects and regional fallback are refused by the adapter. This reduces payload context; it is not a contractual guarantee about every provider processing location.

Data inventory

Data class	Purpose and recipient	Storage and retention evidence
Guest memory text and photos	Property guestbook; host review or restricted safety review; public audience after publication; Google screening	Private submission records; photos in private Sydney buckets. Sydney location is evidenced for the photo buckets only. Approved lifecycle schedules and live object deletion proof pending.
Private feedback	Host complaint inbox or restricted safety review; Google text screening	Submission text moves to host inbox/safety case after delivery/hold. Remaining feedback retention schedules pending.
Consent evidence	Record public-display acknowledgement and exact versions	guestConsent stores wording/version, terms/privacy versions, timestamp, post/property/session reference. Declared 24 months after last message; enforcement not established.
Anonymous session and abuse records	Route guest actions and prevent cross-property misuse; App Check and security controls	Property-specific anonymous Firebase identity. Ten new attempts per UID/hour; cross-identity protection/account expiry incomplete. Firestore/Auth locations require account-specific confirmation.
Reports and privacy requests	Verify requests, takedown, escalation; host or safety operations	Contact email/details, report references and pseudonymous reporter key. 14-day review deadline does not establish final retention/deletion periods.
Restricted safety evidence and access audits	Assess safety/legal cases and record restricted access	Operations requires admin claim plus second-factor token in code. Live MFA, staffing, holds and authorised disclosure process require proof.

Data class	Purpose and recipient	Storage and retention evidence
Host identity and configuration	Login, property settings, support and communications	Firebase Auth/Firestore and host assets; complete regional inventory and processing role review pending.
Billing and accounting metadata	Stripe checkout/subscriptions and business records	DigiStayBook does not store full card details. Five-year accounting value is declared; legal suitability/enforcement requires review.
Marketing preference and suppression records	Express consent, withdrawal and prevention of promotional sends	Privacy draft describes detailed marketing records. Runtime/provider and retention evidence must be reconciled separately.
Logs and daily usage counters	Security, diagnosis, screening capacity and alerts	90-day routine-log value is declared. Screening counters store counts/day/units, not guest text/photos. Full log policy and expiry proof pending.

Storage access and deletion

Sydney storage is currently evidenced for the two guest-photo buckets only. Do not extend that conclusion to Firebase Auth, Firestore, logs, host photos, email or Stripe. Published photos remain in a private delivery bucket and the application checks property/post/submission state on each read; it does not issue permanent photo download tokens.

Public display can create copies outside DigiStayBook, including screenshots, downloaded host exports and browser copies. A server takedown cannot revoke every external copy. Review the guest wording, host responsibilities and export coverage with that limitation in mind.

Record or event	Declared target or behaviour	Approval or evidence needed
Guest self-delete	Immediate hide; primary deletion job due within 72 hours	Live worker success, races, alerts and object-access checks
Quarantine cleanup	24-hour cleanup target	Live worker execution and overdue monitoring
Bucket recovery	7 days of recoverable soft-deleted objects observed	Align restoration rights, privacy disclosure and deletion promises
Backup expiry	30 days after primary deletion declared	Actual backup coverage, manifests, restore exclusions and expiry proof
Consent evidence	24 months after last message declared	Purpose, necessity, trigger and enforced cleanup
Routine logs	90 days declared	Actual logging retention settings and content minimisation
Unpaid drafts and dormant properties	30 days / 12 months declared	Trigger definition, notices and actual automation
Abandoned uploads and rejected content	Schedule not settled	Set duration, owner and cleanup implementation
Anonymous accounts and safety holds	Schedule/hold ownership not settled	Set lawful hold criteria, restricted access, review and expiry
Reports and held feedback	14-day escalation / 30-day review deadline	These are review deadlines, not approved retention periods

Provider and overseas processing review

Selected arrangement: guest-photo storage in Sydney; synchronous Google Vision SafeSearch using the EU hostname; text screening using the Australia Natural Language hostname. The owner approved this arrangement, while account-specific legal/privacy review remains open.

Google publishes service and processing terms and a data-use FAQ. The FAQ distinguishes immediate-response image processing from asynchronous processing. The contractual Vision residency listing must be checked for the actual feature; the project review records an OCR listing rather than a SafeSearch exclusive-region commitment. Endpoint selection is therefore not represented as an EU-only contractual guarantee. See the direct provider references at the end of

this pack.

Counsel should obtain the accepted Google agreement and DPA version, account contracting entity, applicable service terms, subprocessors/countries, transfer safeguards, incident notification contacts and any evidence required to verify commitments. Published links are supplied as references; they do not prove which terms this account accepted.

Priority decision register

ID and topic	Decision required	Decision owner
R01 Operator and jurisdiction	Confirm legal entity, ABN/ACN if applicable, business address and state; test the drafts' Victoria governing-law choice against the actual operator.	Owner and counsel
R02 Roles and obligations	Confirm roles by data class and which privacy, consumer and communications obligations apply to the actual business and markets.	Counsel
R03 Overseas handling	Approve account agreements, provider disclosure, safeguards/countries and accurate endpoint language.	Counsel
R04 Minors and third parties	Approve 16+ wording; address photos of minors/other people, uploader authority and response workflow.	Counsel and owner
R05 Publication rights	Approve licence/consent wording, host responsibilities, public visibility, takedown and external-copy limits.	Counsel
R06 Retention and recovery	Set complete schedules and lawful safety holds; reconcile seven-day bucket recovery and backups with deletion statements.	Owner, counsel and engineering
R07 Incomplete screening	Owner selected consistent pending behaviour on 5 October: incomplete memory and feedback scans wait privately for retry. Local code now withholds feedback on provider failure. Verify bounded retries, truthful guest acknowledgements, deployment and live recovery before release.	Owner and engineering
R08 Screening accuracy and appeals	Approve calibrated thresholds, false-positive target, uncertainty/review wording and review/appeal route.	Owner and counsel
R09 Critical content handling	Serious memory text flags now use the same restricted safety rules as feedback in local source. Complete the memory-case opening/resolution controls, which currently support private feedback only. Verify deployment, host approval denial, operations MFA and case access. Photo flags still use host review: define and calibrate serious-image routing before claiming comprehensive critical handling.	Safety owner and engineering

ID and topic	Decision required	Decision owner
R10 Staffing and notification promises	Name reviewers, hours, urgent handling and incident contacts. Host held-memory/report email worker is not established by the operations-budget email setup.	Owner
R11 Billing and consumer wording	Review 28-day first-property trial, recurring pricing, cancellation, refunds, liability and launch-market consistency against actual checkout.	Counsel and billing owner
R12 Marketing and email claims	Verify consent/suppression implementation and provider before approving the Privacy Policy's communications claims.	Owner, counsel and engineering
R13 Upload and image limitations	Approve limits, transformed-image handling, HEIC outcome and image-contact detection gap; avoid claiming comprehensive safety coverage.	Owner and engineering
R14 Approval record	Approve final versions together; record exact texts, reviewer/date, outstanding conditions and scope.	Counsel and release owner

Owner confirmation during preparation: the user is the operator and handles privacy/safety requests. Legal name, entity structure, address, ABN/ACN if applicable, state, review hours and backup coverage remain unconfirmed. The operations warning address is codebertcreations@gmail.com; designation of this address for published legal/support requests still needs confirmation.

Owner information needed

Operator and privacy/safety request handler: the user, confirmed as "all me". Legal name and business identifiers: PENDING.

Registered/service address and state: PENDING.

Approved published support and privacy contact details: PENDING.

Safety reviewer: the user. Backup reviewer and review hours: PENDING.

Google account agreement and contracting entity: PENDING.

Email provider for host notices and actual communications delivery: PENDING.

Final retention/backup/hold policy: PENDING. Owner: the user.

Appendix A Full Host Terms

Exact source snapshot. draft-2026-08-04 | 4 August 2026. Draft wording is reproduced without silently correcting promises or assumptions.

These Terms and Conditions govern access to and use of the DigiStayBook website, dashboard and digital guestbook services (the “Service”). By creating an account, starting a free trial or using the Service, the Host agrees to be bound by them. Guests using a property’s guestbook are covered by the separate Guest Terms.

1. Description of service

DigiStayBook provides a digital guestbook platform for short-term rental operators. The Service allows Hosts to generate property-specific QR codes enabling checking-in guests to upload photos and text to a digital wall. DigiStayBook is a business-to-business software provider: it does not manage properties, bookings or in-stay support, and does not facilitate host-to-guest direct messaging. DigiStayBook interacts with Guests only where needed to operate content controls and address privacy, personal-data or platform content-safety matters.

2. Account registration and security

The Host must register for an account, is responsible for the confidentiality of their credentials and for all activity under the account, and agrees to notify DigiStayBook immediately of any unauthorised use.

3. Free trial, billing and subscriptions

3.1 Trial. A 28-day free trial applies to the Host’s first activated property. A valid payment method is required to start it. No charge is made during the 28 days.

3.2 Auto-renewal. If the subscription is not cancelled before the end of day 28, the account transitions automatically to a paid subscription and the payment method is charged the standard rate for the selected plan on a recurring basis.

3.3 Cancellation. The Host may cancel at any time through the Host Dashboard. Cancellation must be processed before the next billing date to avoid further charges. Cancellation requests are not accepted by email or contact form. On cancellation the Host retains access to active QR codes and the Guest Wall until the end of the current paid billing cycle or the end of the trial.

3.4 Refunds. Subscription charges are non-refundable except where required by law, including in the event of a major failure under the Australian Consumer Law. Subject to those statutory rights, no prorated refunds or credits are offered for cancelled subscriptions, partial months or unused time.

3.5 Tax. Any statement about tax deductibility is general marketing information only. Eligibility to claim a software subscription as a business expense depends on the Host’s circumstances and jurisdiction, including apportionment between business and private use. The Host is solely responsible for consulting a qualified tax professional.

4. User-generated content and host responsibility

4.1 Guest uploads and platform processing. The Service allows Guests to upload photos, text and other materials (“User Content”). To provide the Service, DigiStayBook stores, automatically screens, routes, publishes, restricts and deletes User Content in accordance with the Host’s settings, the moderation workflow, these Terms and applicable legal obligations.

4.2 Moderation. DigiStayBook applies automated, server-side screening before User Content is eligible for publication. It does not routinely manually pre-screen every submission. Limited manual review may occur for critical internal trust-and-safety cases, legal obligations, escalated platform reports and quality-control activity under restricted access. The Host retains primary responsibility for ordinary curation using the dashboard tools. Automated screening and limited review do not constitute endorsement of User Content.

4.3 Liability for user content. DigiStayBook accepts no liability for User Content uploaded by Guests, including copyright infringement, privacy violations, defamatory statements or offensive material. The Host agrees to indemnify DigiStayBook against claims arising from User Content uploaded to their property’s Guest Wall.

4.4 Guest sessions. Guests do not create formal accounts. Self-service editing and deletion rely on Firebase anonymous authentication and the Guest’s local browser session. Access to edit or delete their own posts is permanently lost if the Guest clears their device data, uses private browsing, or accesses the wall from a different device. The public Privacy & Safety route remains available in that case.

4.5 Private guest feedback

Guests may send the Host private feedback, which is never published and cannot be replied to through the Service. It is checked automatically; feedback that appears to contain threats, sexual content or hate may be held for review by DigiStayBook’s safety team, which may release it to the Host or delete it. The Host may report any feedback message to the safety team, which removes it from the Host’s inbox pending review. Private feedback is not a support or messaging channel, and the Host must not use it as one.

5. Acceptable use

The Service must not be used to promote illegal activity, violence or harassment; to distribute malware, viruses or spam; to infringe intellectual property or privacy rights; or to bypass, attack or disrupt the security and functionality of the Service. DigiStayBook may suspend or terminate an account immediately, without notice or refund, for a violation of these terms.

To enforce these Terms and prevent abuse, DigiStayBook may use rate limits, duplicate-request controls, account or session restrictions, temporary access restrictions and short-lived pseudonymous abuse keys derived from limited security signals. Security records are access-controlled and retained only for the bounded period in the approved retention schedule. These controls do not create persistent cross-session identifiers.

Platform intervention and takedown. While Hosts retain primary responsibility for ordinary curation, DigiStayBook uses automated filters and limited internal review to identify severe legal or safety concerns. Content presenting a critical concern is immediately blocked from public access and placed in a restricted internal case, retained only for the approved verification, legal and safety

period, then securely deleted once the case is resolved and no lawful retention requirement remains. DigiStayBook may apply proportionate account, session or temporary access restrictions and may notify the Host where lawful and safe to do so.

6. Intellectual property

All software, design, text, layout and graphics provided by DigiStayBook - excluding User Content and Host-uploaded property features - are the exclusive property of DigiStayBook. They may not be copied, reverse-engineered or resold without explicit written permission.

7. Service availability and hardware

DigiStayBook provides web-based software. The Host is solely responsible for providing and maintaining the physical hardware - printed QR placards and any display devices - and the internet connectivity Guests need to access the Service at the property. The Service is not guaranteed to be uninterrupted or error-free.

8. Limitation of liability

To the maximum extent permitted by law, DigiStayBook is not liable for indirect, incidental, special, consequential or punitive damages, including loss of profits, data or business opportunity, arising from use of or inability to use the Service. Total liability will not exceed the amount paid to DigiStayBook in the twelve months preceding the claim.

9. Modifications to the terms

DigiStayBook may modify these Terms. Material changes will be notified by email to the account address or by notice in the Host Dashboard. Continued use after changes are published constitutes acceptance of the revised Terms.

10. Governing law

These Terms are governed by the laws of Victoria, Australia, without regard to conflict-of-law provisions. Disputes are subject to the exclusive jurisdiction of the courts of Victoria, Australia.

11. Contact

Hosts with questions about these Terms may use the Host Contact form. Guests and other individuals with a privacy, personal-data or content-safety concern may use the public Privacy & Safety page. Neither route provides booking or property support.

Source review notes

Clause 7: the source draft promised “99.9% uptime”; it is removed because no availability target is set or measured (handbook 5.9). Confirm a measured target or that none is published.

Clause 4.5 is new and covers private feedback, which the 4 August draft predates.

Appendix B Full Guest Terms

Exact source snapshot. draft-2026-10-02 | 2 October 2026.

These terms apply when you use a property's DigiStayBook guestbook as a guest: reading its wall, adding a memory, or sending private feedback to your host. You do not need an account. The host of the property runs their guestbook; DigiStayBook provides the software.

1. Adding a memory

A memory is a message and up to ten photos for the property's guestbook wall. By submitting one you confirm you are 16 or older, that you took the photos or have the right to share them, and that everyone recognisable in them is happy for them to be shown.

You consent to your memory being shown publicly on that property's guestbook, including on screens in the property and on any page where the host displays their wall. The host may hide, pin or remove memories, and nothing you post is guaranteed to stay up.

2. Private feedback

Private feedback goes to your host only and is never shown on the wall. It is not monitored in real time and your host cannot reply to it here. It is not a way to get help during your stay: for anything urgent, contact your host through your booking app, or the emergency services if anyone is in danger.

3. Screening

Memories and private feedback are checked automatically before they reach the wall or your host. Memories that may break these terms are held for review and may never be published. Private feedback that appears to contain threats, sexual content or hate may be held for DigiStayBook's safety team, who may pass it to your host or delete it. Automated checks are not perfect, and their result is not an endorsement of anything posted.

Photos are stored in Sydney, Australia. Automated photo safety checks involve overseas processing by Google Cloud Vision, configured to use its European Union service endpoint. Google may also handle information in other countries under its service and data-processing terms. See the Privacy Policy for details.

4. What you must not post

Nothing illegal, threatening, harassing, hateful or sexually explicit; nothing that shares someone else's personal information without their permission; no photos of children who are not yours; no advertising, spam or links meant to mislead; and nothing you do not have the right to share. Content that breaks these rules may be removed, and the session that posted it may be restricted.

5. Changing or removing what you posted

From the same browser you used to post, you can edit or delete your memories at any time. If you have cleared your browser, used private browsing or changed device, use the Report control on the memory or the Privacy & Safety page to ask for it to be removed.

6. Who to contact

For privacy, personal-data or content-safety concerns, use the public Privacy & Safety page. It does not provide booking, maintenance or in-stay support; contact your host through your booking app for those.

7. Governing law

These terms are governed by the laws of Victoria, Australia. Nothing in them limits rights you have under consumer or privacy law where you live.

Source review notes

These Guest Terms are new: the handbook's A.6 covers Hosts only, while the guestbook form has always linked to "Guest Terms".

Age threshold (16) and the minors workflow are open register item C-11.

Whether a licence from the guest to the host and DigiStayBook is needed for display, beyond consent, is for counsel.

Review the overseas photo-screening disclosure together with Privacy Policy section 4.1 and consent version handbook-5.3-draft-v3; this acknowledgement does not waive privacy rights.

Appendix C Full Privacy Policy

Exact source snapshot. draft-2026-10-02 | 2 October 2026.

1. Information collected

From Hosts: account information (email address, password, property names); billing information collected by Stripe, which DigiStayBook does not view or store in full; property configuration data such as welcome messages, house rules and display preferences; and marketing preference data - the host identity, normalised contact address, consent or withdrawal status, UTC timestamp, form or source identifier, and the exact consent wording and version. A minimal central suppression record is kept separately to prevent promotional messages after opt-out.

From Guests: user-generated content voluntarily uploaded to a Guest Wall; and limited technical and security data - IP address, browser type, device category, access time, anonymous session tokens and Firebase App Check signals. Where needed to prevent abuse, short-lived pseudonymous abuse keys may be derived without creating a persistent cross-session identifier. This information is used to route uploads, secure the Service, enforce rate limits, investigate reports and apply proportionate restrictions. It is access-controlled and retained only for the bounded period in the approved retention schedule.

1.1 Private feedback and automated screening

Guests may also send a Host private feedback. It is shown only to that Host and is never published.

Guest messages, photos and private feedback are checked automatically using Google Cloud's content moderation services before they are published or delivered. Private feedback that appears to contain threats, sexual content or hate may be held and read by DigiStayBook's restricted safety team, who release it to the Host or delete it. A Host may also send a feedback message to the safety team for review. Each time the safety team opens a held message, that access is recorded; the record does not contain the message.

2. How information is used

To provide the Service: hosting the guestbook, generating QR codes, and enabling Host moderation.

To process payments, subscriptions, trials and renewals through the payment gateway.

To communicate with Hosts: account notices, billing receipts, moderation alerts, cancellation confirmations and dashboard access links.

To manage marketing choices: proving express consent, applying withdrawals across all promotional sequences, preventing sends to suppressed addresses and recording verified re-consent. Account creation and acceptance of the Terms are never treated as marketing consent.

To improve the Service through analysis of usage and technical data.

Guest photos and messages are not used for DigiStayBook's own marketing without explicit permission, and Host and Guest data are not sold to third parties.

3. Privacy roles by data class

Guest Wall content and property configuration: the Host generally determines why Guest photos, messages and property content are collected and displayed, and acts as controller. DigiStayBook generally processes this content on the Host's behalf to host, screen, route, publish, restrict and delete it under the Service instructions.

Host accounts and communications: DigiStayBook is controller for registration, account security, service communications and the support records needed to operate the platform relationship.

Billing metadata and transaction records: DigiStayBook is controller for customer, subscription, invoice-reference and accounting information needed for billing, disputes and legal obligations. Payment providers process payment data under their own terms and roles.

Security and abuse-prevention records: DigiStayBook is controller for App Check signals, limited security logs, short-lived pseudonymous abuse keys, rate-limit events and account or session restrictions.

Platform reports and internal trust-and-safety cases: DigiStayBook is controller for reports escalated directly to the platform and for restricted critical cases it must assess for platform safety, legal compliance or user protection.

Service providers: cloud, email, moderation and other vendors process data under the contractual role applicable to their service.

3.1 How a Guest exercises deletion rights

Active session: use the self-service delete control directly on the device that made the post.

Lost session: use the Report control on the post and select "Privacy - I want my content removed". An accepted ordinary request hides the post immediately and routes it to the Host. If the reporter or wall circuit breaker is active, the request is recorded without changing visibility and is routed to Privacy & Safety Operations.

Public route: submit a request through the public Privacy & Safety page if self-service is unavailable, the session is lost, the post cannot be located, or a previous request was not handled.

Escalation: if the Host does not act within 14 days, the request escalates to Privacy & Safety Operations, which applies the approved deletion or restriction workflow. DigiStayBook may also act directly where required by law or where it is independently responsible for the data class.

4. How information is shared

Information is shared only with service providers performing services on DigiStayBook's behalf (cloud hosting, payment processing, email delivery, content moderation); where required by law, court order or governmental request, or to protect the rights, property or safety of DigiStayBook, its users or others; and in the event of a merger, acquisition or sale of assets, where Host data and Guest content may transfer as a business asset.

4.1 Photo storage and overseas safety checks

Guest photos are stored in Sydney, Australia, in private Google Cloud Storage buckets. Photos undergo automated safety checks using Google Cloud Vision SafeSearch, configured to use its European Union service endpoint. The photo is sent overseas for that check; Sydney storage does not mean all processing stays in Australia.

We use immediate-response photo checks. Google states that these checks process the image in memory without persisting it to disk, and that submitted content is not used to train or improve Cloud Vision models. Google temporarily logs some request metadata, such as the request time and size.

Google processes service data under its Cloud Data Processing Addendum, including security, confidentiality and incident-notification commitments. Google and its contracted service providers may handle information in other countries under those terms. Our choice of the EU endpoint is not a guarantee that every aspect of Google's handling remains in the EU. Text screening is configured to use Google Cloud Natural Language's Australia endpoint.

5. Data retention and deletion

Personal information is kept only as long as the approved retention schedule allows, then destroyed or de-identified, including controlled copies in archives and backups. Business records are kept for the period Australian tax law requires, and marketing consent records and unsubscribe requests are handled within the periods ACMA requires.

6. Cookies and tracking

Essential cookies maintain Host login sessions and platform security. No invasive tracking cookies are used for targeted third-party advertising.

7. Data security

Administrative, technical and physical measures protect personal information. No electronic transmission or storage technology can be guaranteed completely secure.

8. Children's privacy

The Service is a business-to-business platform and is not directed at children under 16. Personal information is not knowingly collected directly from children, and Guests must confirm they are 16 or older before posting a memory. Hosts remain responsible for moderating photographs containing minors uploaded to their Guest Wall.

9. Contact

Hosts may use the Host Contact form for account and software support. Any Guest, Host or other individual may use the public Privacy & Safety page for a personal-data request, privacy concern or content-safety issue. That route does not provide booking, maintenance or in-stay support. Requests that cannot be resolved through self-service or the Host workflow escalate to Privacy & Safety Operations.

Source review notes

Section 1.1 is new: private feedback, Google Cloud screening and safety-team access postdate the 4 August draft.

Section 8 now says “16 or older before posting a memory” to match the consent sentence; the draft said “over 16 before uploading content”.

Section 5 summarises the draft’s pointer to the handbook’s retention schedule (5.10), which is internal; the published policy needs the schedule itself or a public summary of it.

Section 4.1 records the 2 October owner decision: Sydney photo storage and overseas screening through Google Vision’s EU endpoint. Review the actual account agreement, overseas-disclosure safeguards and country disclosures: Google’s contractual Vision data-residency list currently covers OCR only, not SafeSearch. Do not turn the endpoint choice into an EU-only guarantee.

Confirm Google Cloud’s processor/subprocessor role for each data class, applicable account terms, provider notices and the final overseas-country disclosure. The email provider remains open (C-14).

Appendix D Consent and guest reporting

Exact consent wording

Version handbook-5.3-draft-v3

I agree to the Guest Terms and Privacy Policy, understand that photos undergo automated safety checks involving overseas processing, consent to my message and any photos being displayed publicly on this property's guestbook, and confirm I am 16 or older.

The server stores the exact wording/version and the Guest Terms/Privacy versions with the consent event. Same-session guest controls use the anonymous identity; the public reporting route exists for lost sessions and third-party concerns. The declaration is not evidence of identity/age verification.

Current Privacy and Safety page wording

Privacy & Safety

Use this route for a personal-data request, content takedown request or urgent platform safety concern. Booking, property and in-stay support remain with the Host or booking provider.

DigiStayBook cannot help with bookings, property access, maintenance or in-stay issues.

Contact your host through your booking platform for stay support. Use this form only for privacy, personal-data or DigiStayBook content-safety concerns.

Request type: Privacy request; Content takedown; Urgent safety concern.

Details: include the property or wall reference, and the post reference if you have one. Maximum 2,000 characters.

Contact email: used only to verify and respond to this request.

Submitting a request does not automatically approve deletion. Your contact details are used to verify and respond to your request.

Success acknowledgement includes a reference and states that the request has not yet been verified or approved. Source: `src/ui/pages/PrivacySafetyPage.tsx`. Review the word urgent against actual staffing and response capabilities; no staffed emergency response is established by this page.

Private feedback boundary wording

It isn't monitored in real time and your host can't reply here - for help during your stay, message them through your booking app. Messages are checked automatically; ones containing threats, sexual content or hate may be held for a safety review first.

Appendix E Screening and controlled release

The pack includes 20 labelled synthetic text examples and an image-acquisition plan. Labels are proposed product outcomes. No representative image set or provider calibration results are claimed. There are coverage gaps, including sexual/hate text examples and real image classification; licensed/authorised images must be acquired before those categories are validated.

Release evidence	Pass criteria and record
Provider access	Deployed runtime identity can call both providers and access transformed photo bytes; record revisions and classifications
Calibration	Label cases before execution; record all errors/mismatches, investigate harmful misses and approve thresholds/false-positive target
Provider failures	Malformed, missing, timeout and 403/429/5xx responses cannot publish memories or deliver feedback; verify bounded retry/recovery and operations alert after repeated failures
Shared text decisions	Clear memories publish; ordinary memory flags require host review; serious text flags in both routes open restricted safety cases; ordinary feedback reaches only the private host inbox
Daily allowance	100/day shared attempts including edits/feedback/retries; warning at 75; denied 101st call; reset at Sydney midnight; pending work recovers
Email warning	Observe receipt at codebertcreations@gmail.com; distinguish configuration from delivery
Guest controls	Real QR/stay token, property-specific anonymous identities, App Check, publication/review/edit/delete and isolated private feedback
Storage and deletion	Direct-access denial; live cleanup workers and deletion deadlines; no deleted/restricted content in ordinary host exports
Operations	Named reviewer, MFA, restricted access, audit/escalation and appropriate host/operations notices
Devices	Android/iPhone, HEIC, ten-photo limits, interrupted upload, accessibility and actual wording
Legal and release	Final approval recorded, draft notices removed, approved versions deployed and NAS copies synchronised; controlled rollout reviewed before expansion

The current 100-attempt cap is not a monetary cap. One memory with ten photos is one attempt, and failed provider calls also consume attempts. It does not bound storage/delivery costs. A 24-hour monitoring repeat limit can delay another warning on a subsequent calendar day if it falls within that window; review whether a per-calendar-day notification policy is needed.

Appendix F References and included evidence

Google Cloud Data Processing Addendum -

<https://cloud.google.com/terms/data-processing-addendum>. Published processing terms; accepted account agreement still required.

Google Cloud Services Data Residency - <https://cloud.google.com/terms/data-residency>. Check exact service and feature commitments.

Google Vision Data Usage FAQ - <https://docs.cloud.google.com/vision/docs/data-usage>. Immediate versus asynchronous image processing.

Google Cloud subprocessors - <https://cloud.google.com/terms/subprocessors>. Reviewer should retrieve current register; automated retrieval did not succeed.

Google Cloud service terms - <https://cloud.google.com/terms/service-terms>. Applicable service commitments and conditions.

Vision pricing - <https://cloud.google.com/vision/pricing>. Per-image screening usage.

Natural Language pricing - <https://cloud.google.com/products/natural-language/pricing>. Text moderation units.

OAIC privacy resources - <https://www.oaic.gov.au/privacy>. Reviewer reference; no applicability opinion supplied.

Provider DPA, residency and Vision data-use pages were opened during preparation. The subprocessor link is supplied for reviewer follow-up, with retrieval failure disclosed. No complete copyrighted provider contracts have been copied into this pack. Public provider references do not establish account acceptance or legal suitability.

Included evidence: exact legal source and JSON export; processing/screening/reporting/deletion source; Firestore and storage rules; retention and billing policy source; guest issue register; provider review; daily allowance record; handoff; implementation/gap records; full operating handbook; live metadata snapshot; synthetic text fixtures/image plan; reviewer response form; SHA256 manifest.

Appendix G Reviewer response and approval

Please return a marked-up document or complete reviewer-response.md. Approval should identify each document/version, scope, reviewer and date. Record any conditions that prevent release; do not use a blanket approval if the reviewed text differs from the deployed text.

Reviewer name and firm: _____

Review date and scope: _____

Decision: approve / approve subject to conditions / further work required.

Approved Host Terms version: _____

Approved Guest Terms version: _____

Approved Privacy Policy version: _____

Approved consent version: _____

Required amendments and unresolved decisions: _____

Conditions that must be met before controlled intake: _____

Evidence requested from engineering or the operator: _____

Approver signature or written approval reference: _____

Engineering release record: version all final texts; record legalApproval only after approval is received; deploy; verify visible wording and stored consent versions; synchronise handbook/NAS; perform controlled end-to-end tests; record remaining operational conditions before wider launch.
